ABSTRACT

This thesis documents the development of an on-line information technology management (ITM) research catalog that can be accessed by DOD and DON agencies or other interested parties via the World Wide Web. The on-line research catalog allows the ITM professors at the Naval Postgraduate School (NPS) to quickly and easily maintain their own research information regardless of their operating platform.

The logic for a multi-user relational database approach to managing the research catalog is addressed. A semantic object model and a relational diagram are developed to create a conceptual design for the database. Next, the application process and description of the common gateway interface (CGI) scripts are presented. Chapter four displays and discusses the catalog's major user interfaces. Finally, this thesis concludes with a plan for using the system and recommendations for further improvements.

I. INTRODUCTION

This thesis documents the design and implementation of an on-line Faculty Research Catalog for the Information Technology Management (ITM) Group of the Systems Management (SM) Department at the Naval Postgraduate School (NPS). The on-line research catalog contains significant research information by ITM professors and is accessed via the World Wide Web (WWW).

A. BACKGROUND

A recent graduate of NPS, Barbara Franklin, did a thesis in which she collected and consolidated the ITM professors' diverse backgrounds and various research interests in an attractive brochure. The goal of the brochure is to provide research information to the many geographically dispersed DOD/DON agencies and solicit research sponsors for further research opportunities. This brochure is in a hardcopy and electronic form. The electronic form currently resides as a series of static web pages on the WWW.

B. PROBLEM DEFINITION

The current research catalog does not allow the ITM professors to have ownership and easily maintain their respective pages in the brochure. Consequently, these static pages have not been updated since their inception last September and are quickly becoming obsolete. In addition, since the catalog also exists as a series of web pages, there is no central repository to contain the data. As a result, the catalog contains redundant information. Most of the redundancy occurs between the faculty research pages, research areas and recent publications' sections of the catalog.

For instance, it is common for ITM professors to co-author a publication. This same publication may appear on their respective research pages as well as the other two earlier mentioned sections.

C. OBJECTIVE

The research catalog consists of common fields of information that needs to be maintained (add, modify, and delete); this makes the catalog the ideal candidate to store its information in a relational database. The database must reside on a server that will provide an acceptable response time.

All of the ITM professors have access to the internet. The internet uses a protocol called TCP/IP that allows access to the WWW regardless of the users operating platform. For this reason the on-line research catalog is a WWW client/server application that allows ITM professors to easily and immediately maintain their own research information and have it available for world wide access. Figure 1 depicts the above process.

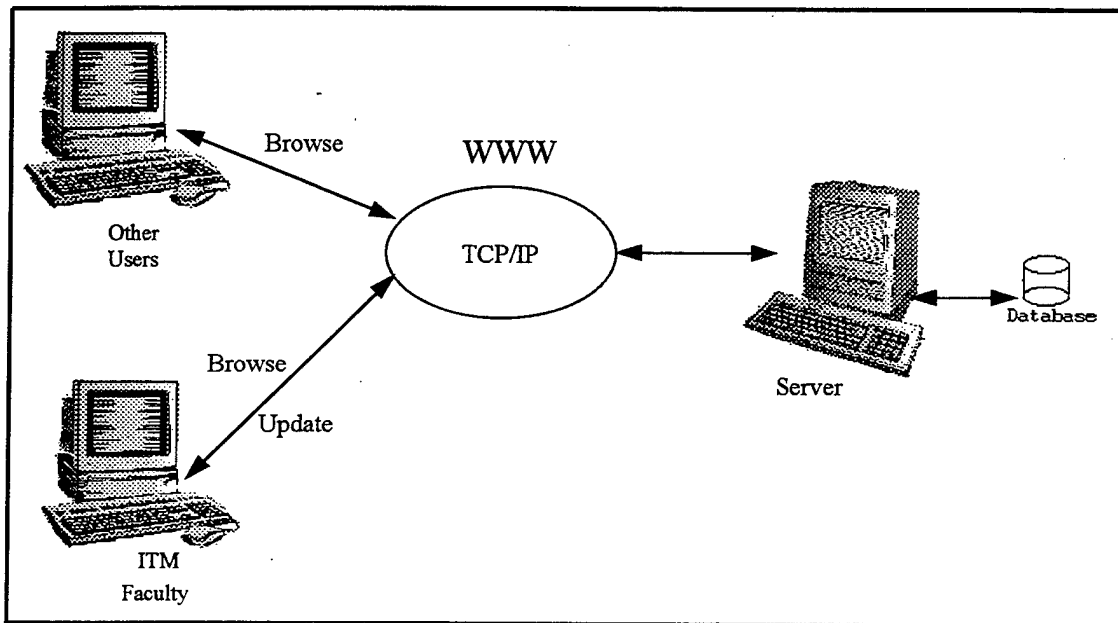

Figure 1. WWW Client/Sever Model for the On-line Research Catalog

D. METHODOLOGY

A review of the existing ITM group faculty research catalog was conducted to familiarize the author with the format. Next, selected ITM faculty members were personally interviewed to obtain additional information and user requirements. The author chose Delphi, an object-oriented language, to be the interface between the user and the database. A context diagram and data flow diagrams were developed to depict the process of maintaining the ITM research catalog. Finally, a semantic object model and relational diagram were created to design the database.

The author's recent educational background in systems analysis and design methods, relational databases, and HTML proved to be extremely helpful in the development of the on-line research catalog application. The author assumed the roles of ITM faculty member, other users and system administrator in the development of the application.

II. THE DESIGN AND IMPLEMENTATION MODELS

This chapter describes the semantic object model as a database design model and its conversion to the relational model for implementation.

A. THE SEMANTIC OBJECT MODEL

The research catalog database was designed using SALSA, a data modeling tool. The semantic object model of the data maintained by the research catalog is shown in Figure 2. Below is a brief description of each semantic object. A semantic object is a representation of some identifiable things in the users' work environment about which he wants to maintain[Ref. 1].

- **Faculty_Account:** Gives authorization for faculty members to access the database.
- **Faculty:** Contain detailed information about each faculty member.
- **Research_Page:** Documents the research interests of a faculty member.
- **Publication:** The publications that a faculty member written.
- **Journal:** A subset of the Publications object.
- **Book:** A subset of the Publications object.
- **Other_Pub:** A subset of the Publications object.
- **Faculty_Research_Area:** Research categories that broadly describe research common to several professors.
- **Research_Subarea:** Narrower descriptions of some of the broader research areas.
- **Research_Center/Lab:** Provides a description of each center or laboratory, current research topics, and a point of contact.
- **Sponsor:** Identify recent sponsors of the ITM professors.

- Sysad_Account: Contains account information on the person who monitors and maintains the entire contents of the database.

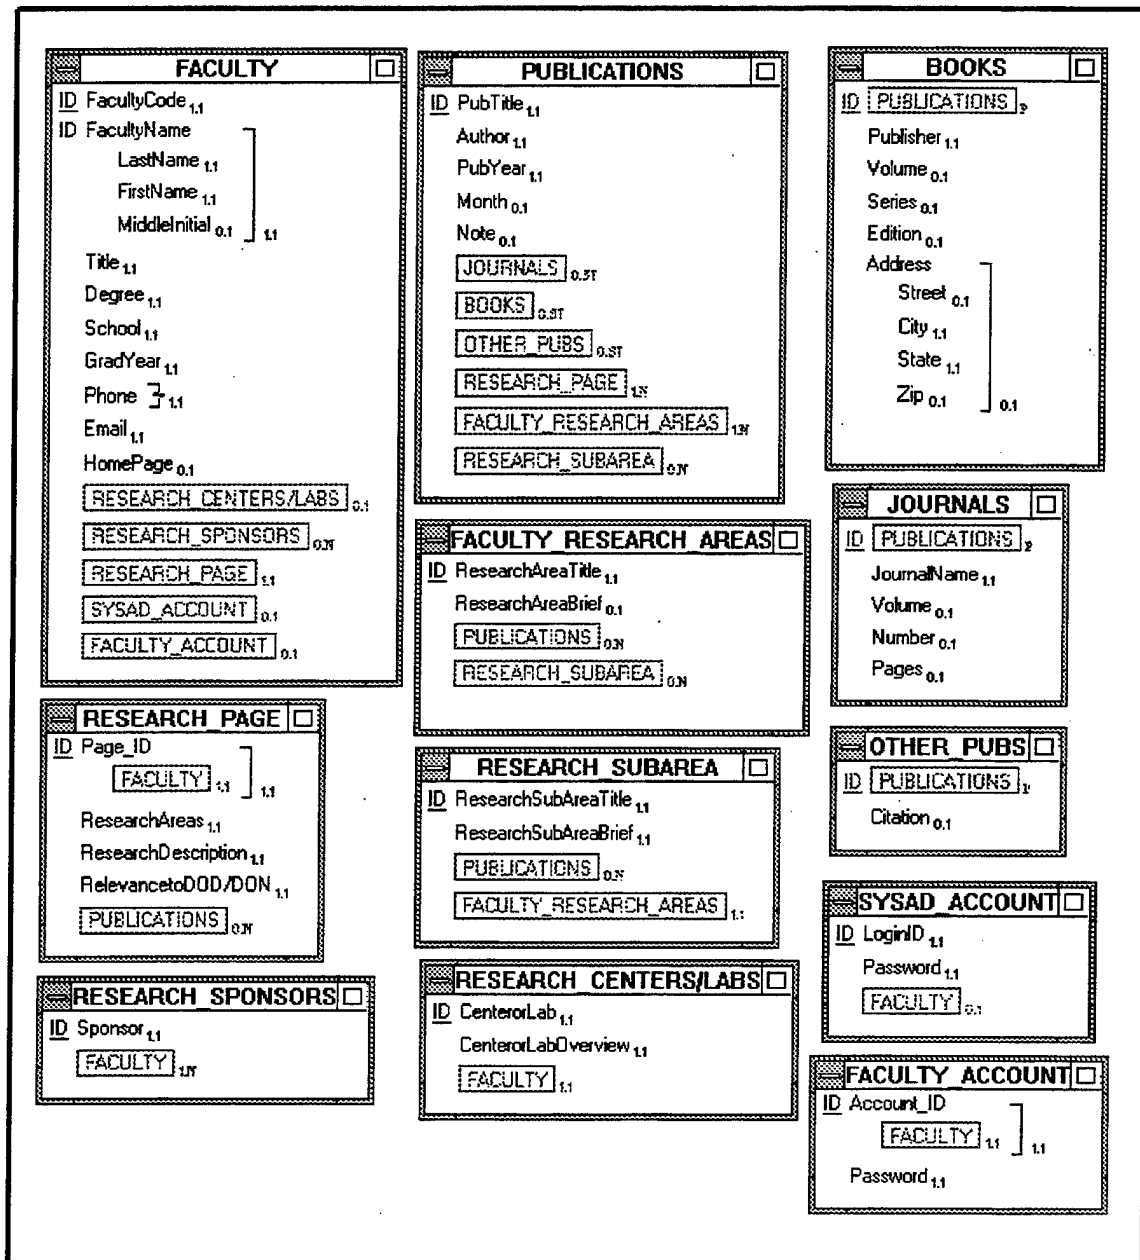

Figure 2. Semantic Object Model

B. THE RELATIONAL MODEL

The semantic object model cannot be directly implemented into a database.

SALSA provides a method to generate a database schema from a semantic object model.

A database schema defines a database's structure, its tables, relationships, domains, and business rules [Ref. 1].

The relational model is a particular way of structuring and processing a database.

It shows in an understandable way how the database data is stored as tables and their relationship to one another. Figure 3 shows the data that is stored and the relationship among the rows that represents tables of the database.

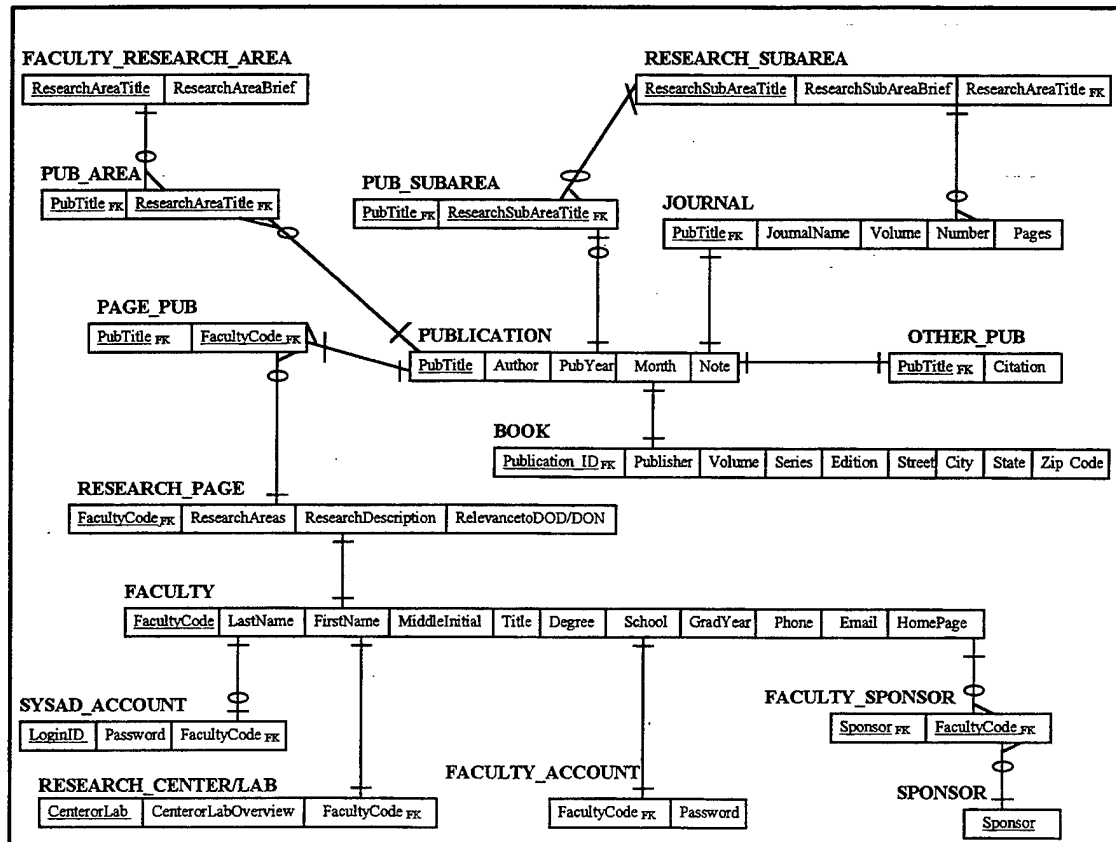

Figure 3. Relational Diagram of the Database

The complexity of the database is clearly represented in Figure 3. For instance, a publication can be a journal, book, or other publication type and can have one or more authors that may or may not all be ITM professors at NPS. Therefore, the best approach to uniquely identify a publication is by its title. Another reason for the complexity of the database is the same publication can appear on one or more faculty's research page as well as the research areas/subareas. This is because a research area can have subareas and the same publication can exist in a research area as well as a subarea of a different research area.

III. APPLICATION PROCESS

This chapter discusses the contents and process of the ITM on-line research catalog application. It concludes with a description of the various CGI scripts that comprises the catalog.

A. APPLICATION CONTENTS

The database content of the on-line research catalog consists of 5 sections: faculty research pages, faculty research areas, research centers and laboratories, recent research sponsors, and recent publications. A discussion of each section is presented below.

The faculty research page provides professional information about each ITM professor. It identifies and describes their research specialty, explains the relevance of their research to DOD/DON, and list their pertinent research publications.

The faculty research areas provide brief descriptions of the ITM group's research efforts. Some research areas are too broad to adequately describe some of the professor's research efforts and are broken into subareas. The research areas and subareas (unbulleted items) are arranged as follows:

- Database Management Systems
- Decision Support and Expert Systems
 - Decision Making in Dynamic Environments
 - Decision Support Systems
 - Instructional Multimedia Systems
- Model Management

- Networks and Communications
 - Distributed Systems and Computer Networks
 - Telecommunication Systems
- Software Engineering and Applications Development
 - Application Development
 - Software Engineering and Project Management
 - Software Metrics
 - Software Reliability

The research centers and laboratories' section provide a description of each ITM center or lab. It explains why each center or lab was formed, and list a point of contact.

The research sponsors section gives recognition to sponsors of recent research projects. Sponsors are listed in alphabetical order.

The recent publications' section displays a listing of all recent publications by the ITM group. This section consists of the publications from all the faculty research pages.

B. DATA FLOW DIAGRAMS

This section uses data flow diagrams (DFDs) to depict the flow of data through the system and the processes that are performed by the system. As shown in Figures 4 and 5, the on-line research catalog is designed for three types of users: ITM professors, system administrator, and other WWW clients. The ITM professors and system administrator both have query and update privileges. The other WWW clients have only query privilege.

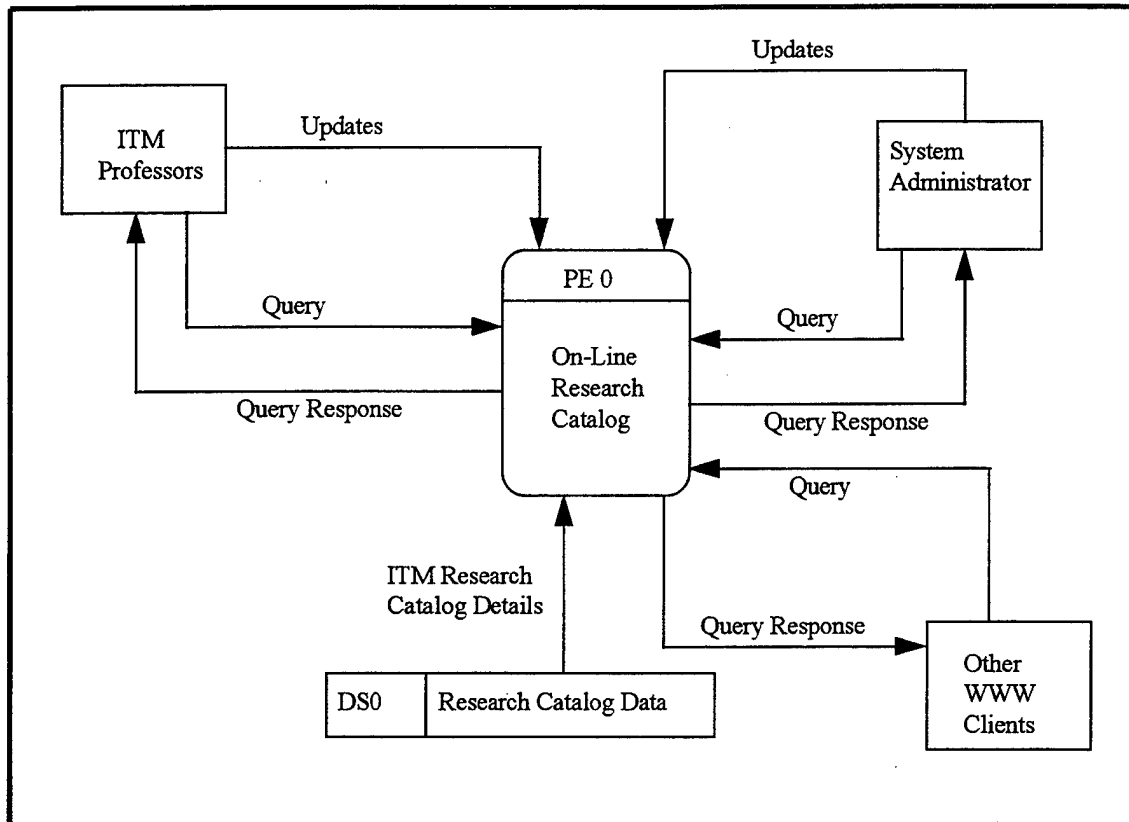

Figure 4. Context Diagram For ITM Research Catalog

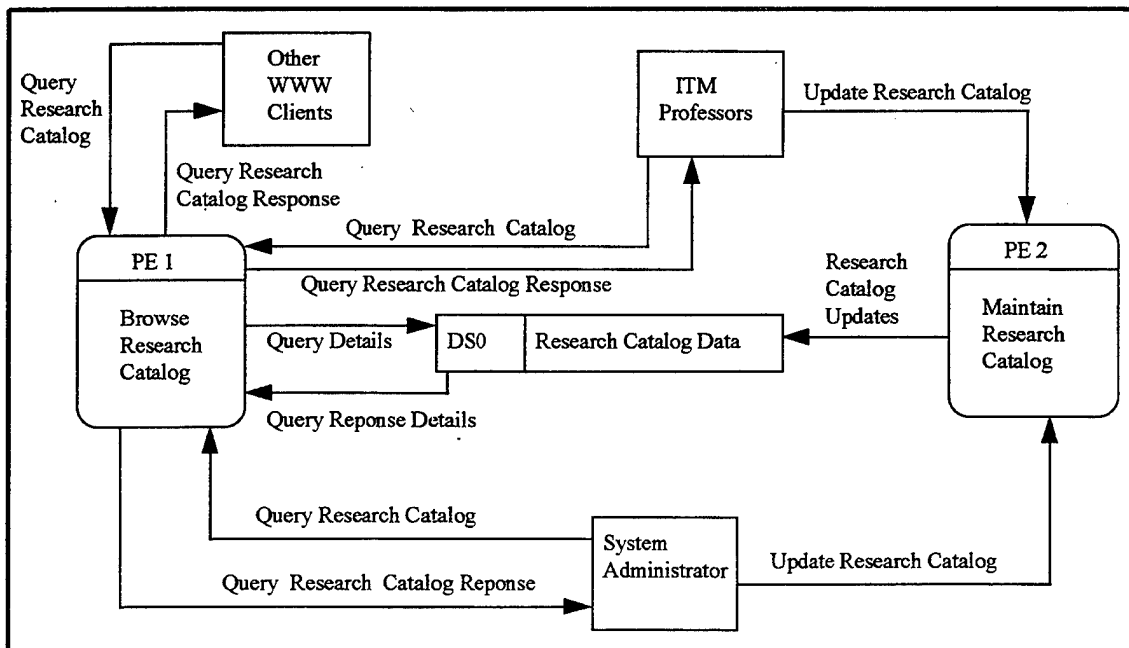

Figure 5. Overview DFD For ITM Research Catalog

The two types of users that will maintain the research catalog are the system administrator and ITM professors. Figure 6 shows that the ITM professors can only maintain certain parts of the catalog, whereas, the system administrator can maintain the entire catalog. A major user requirement of the catalog is to allow a professor to maintain information that specifically relates to his research page. In order to do this, state information about each professor passes between CGI scripts using a hidden field. A hidden field is an HTML form option that can pass data to CGI scripts without requiring the user to actually enter the data. The other areas of Figure 6, except for maintain systems account, are considered common areas, e.g., relate to more than one professor. For this reason, the system administrator is the only person allowed to update those areas for the purpose of keeping system integrity.

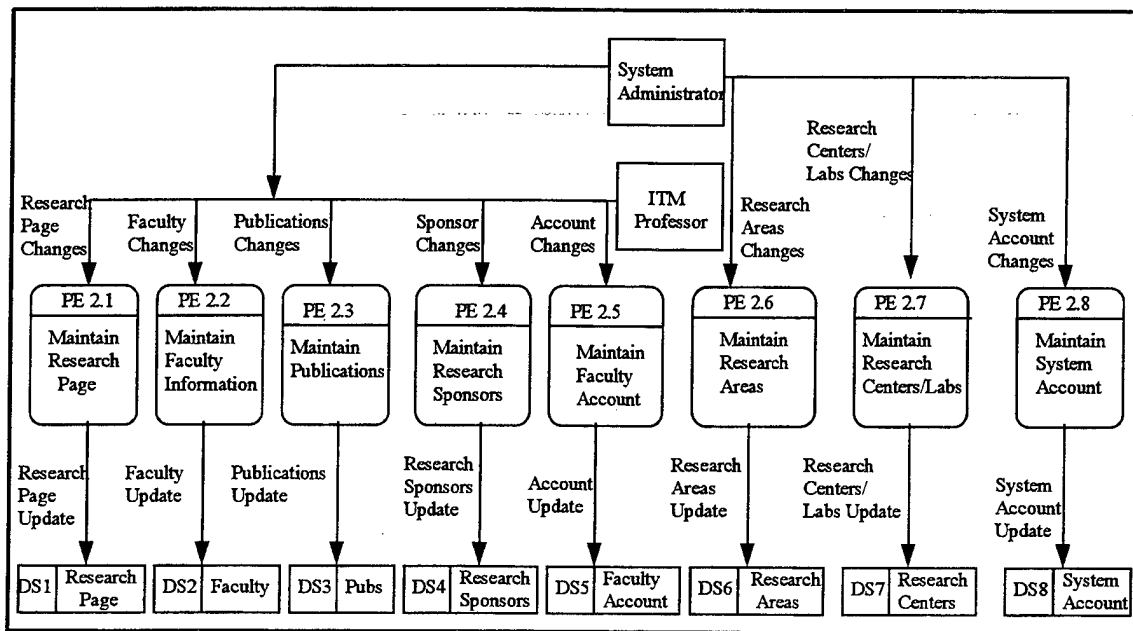

Figure 6. Middle Level DFD For ITM Research Catalog

Figure 7 shows the add, modify, and delete research page processes. What is not shown from the figure is a professor must include his faculty information when he adds a research page and if he deletes a research page, he also deletes his faculty information. This is done to prevent a research page from existing without its respective faculty information. Although faculty information is part of a research page, modification of a research page does not include modification of faculty information, that is a separate process as shown in Figure 8.

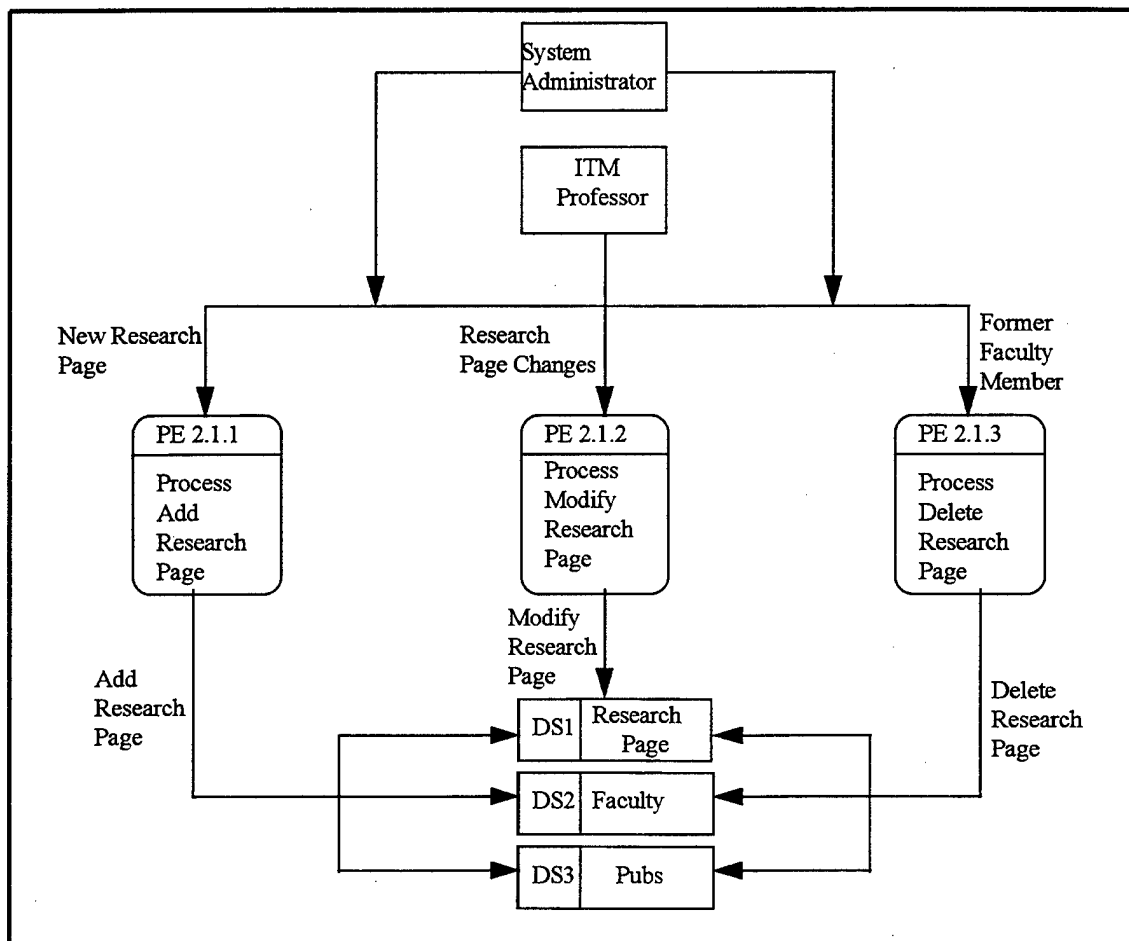

Figure 7. Primitive Level DFD For Maintaining a Research Page

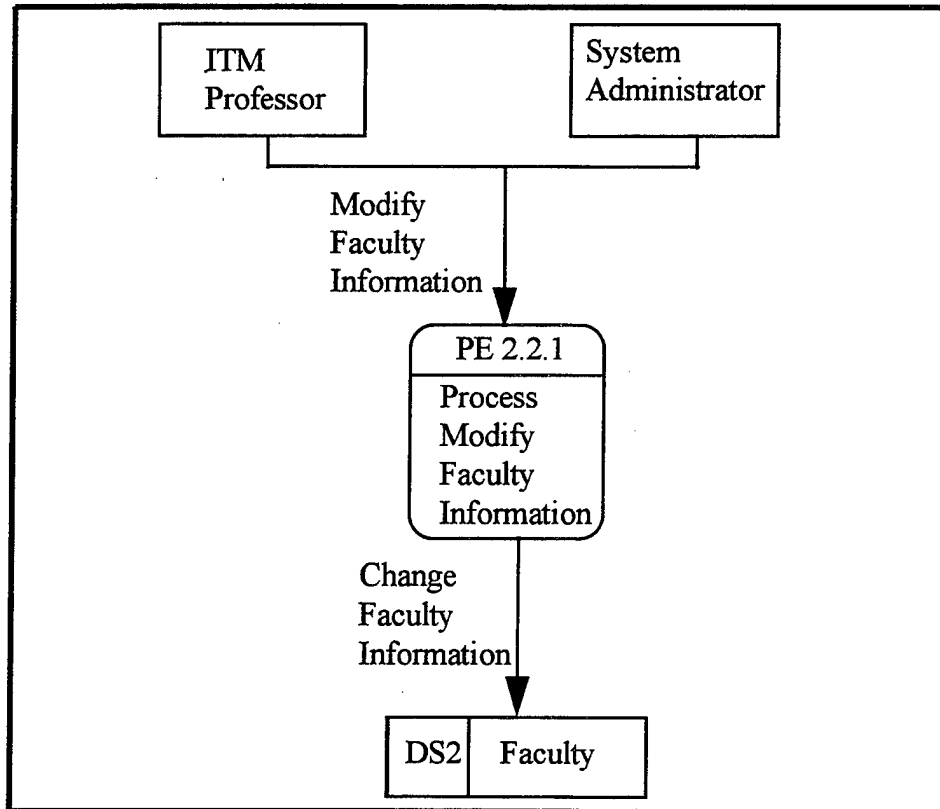

Figure 8. Primitive Level DFD For Maintaining Faculty Information

Figure 9 shows the publication process. A professor can add or delete a publication only from his research page and desired research areas. He can not completely delete a publication entirely from the research catalog. The logic for this is best explained using the following scenario. Professor 1 may have co-authored a publication with professor 2 who has the publication on his research page. If professor 1 is allowed to delete the publication entirely, then it will affect professor 2's research page. Only the system administrator can delete a publication entirely from the catalog assuming all authors involved agree. There is no publication modification process because the title of the publication is its key and cannot be modified.

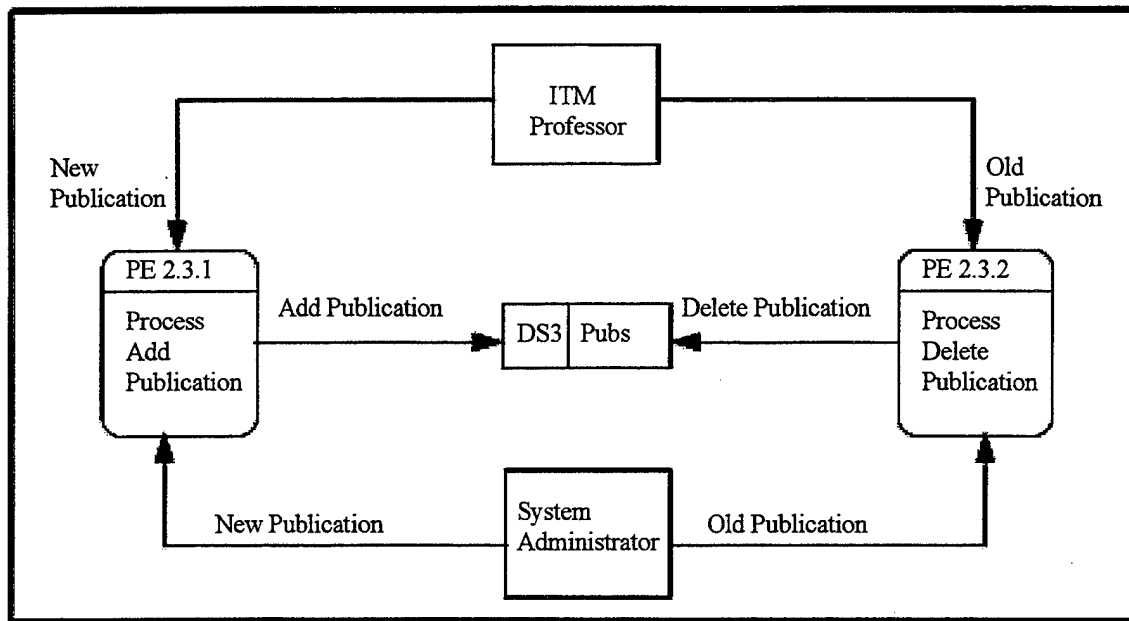

Figure 9. Primitive Level DFD For Maintaining Publications

One of the objectives of the on-line research catalog is to attract sponsors to financially assist the ITM professors in their research efforts. Each professor can add and delete his respective sponsors, Figure 10.

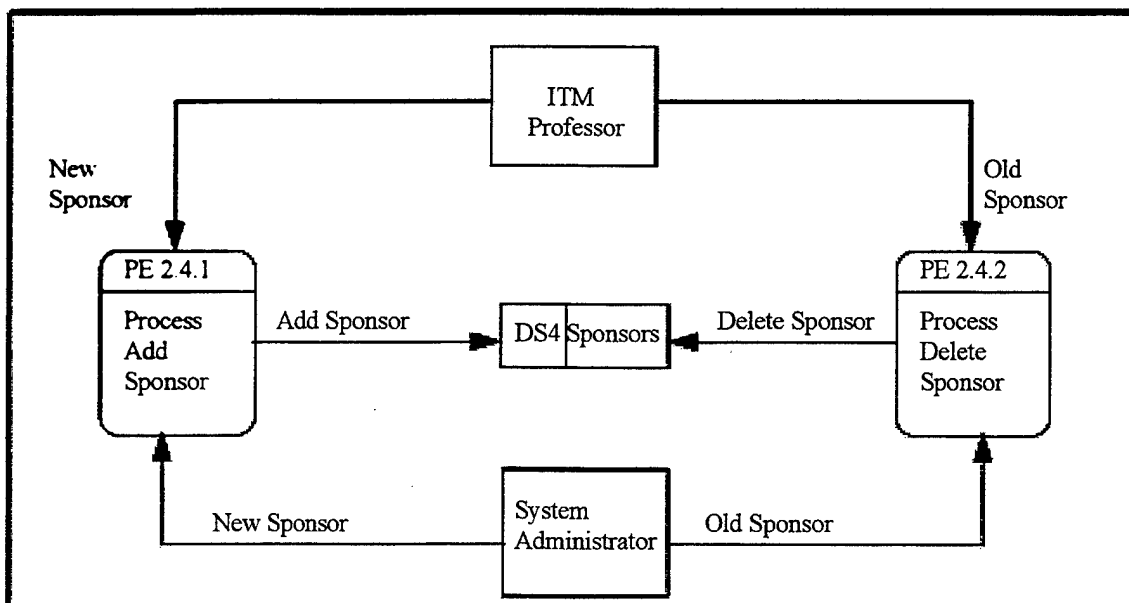

Figure 10. Primitive Level DFD For Maintaining Sponsors

A professor must have an account in order to maintain his own research page. An account contains a professor's unique faculty code and password that he enters to log into the system. The system administrator is the only person that can add or delete an account for a professor, Figure 11. Once a professor has an account, he can modify it, Figure 12. Modifying a faculty account only entails changing the password; the faculty code cannot be changed. If a professor's account is deleted, he can no longer log into the catalog to maintain his research information. Therefore, the system administrator should only delete a faculty account on the departure of the respective professor from the ITM group.

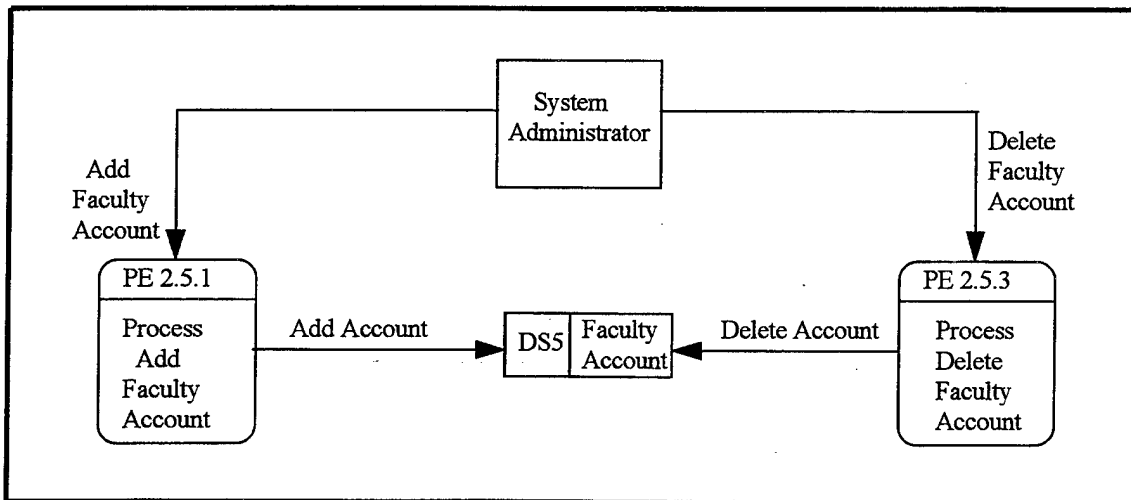

Figure 11. Primitive Level DFD For Maintaining Faculty Account

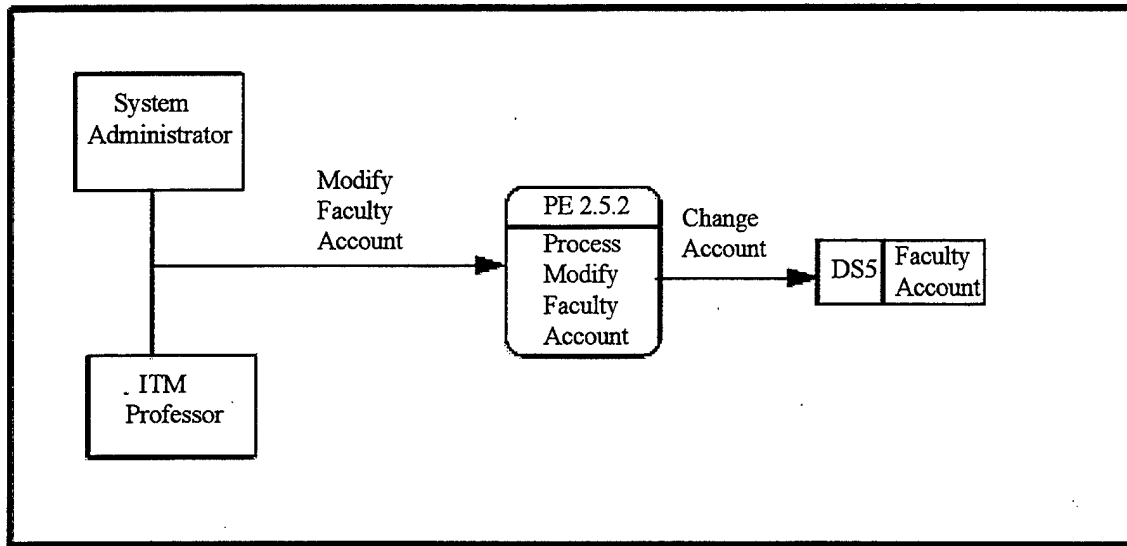

Figure 12. Primitive Level DFD For Maintaining Faculty Account

The remaining Figures, 13-15, are only processes that are only maintained by the system administrator and are self-explanatory.

C. CGI SCRIPTS DESCRIPTION

CGI scripts are short programs that execute in real time and reside in a special directory of a web server. They lend themselves particularly well to the task of accessing a database. CGI scripts are written in different programming languages. The on-line research catalog scripts are written in Delphi and can be categorized into the following groups: add, modify, browse, and delete.

1. Add Scripts

These scripts display an HTML input form to collect information on what the user wants to add, i.e., a research page, publication, etc., to the database. Once the information is collected another form accepts the data and adds it to the appropriate tables in the database.

2. Modify Scripts

These scripts use an HTML form to display current information about the item the users want to update. The user can make any desired changes on the form. Once submitted, it is received by another script that takes this new data and modifies the appropriate tables.

3. Browse Scripts

The browse scripts do not accept any data, just displays it. The browse research centers/labs are the only browse scripts that have links to other HTML pages.

4. Delete Scripts

There are two types of delete scripts: one that permanently removes the information from the database and the other just removes it from being displayed. The latter applies only in the case of publications. For example, a publication can be deleted from a research page and/or research area. The publication still exists in the database, but is removed from the selected item(s). If a publication needs to be deleted entirely from the database, only the system administrator has the privilege to perform that task.

IV. THE USER INTERFACE

This chapter describes the main user interfaces for the three different types of on-line research catalog users: WWW clients, ITM faculty, and system administrator. All users with a frames capable browser will first access the welcome page, Figure 16. Then, depending on the type of user they are, will mainly interact with one of three menus.

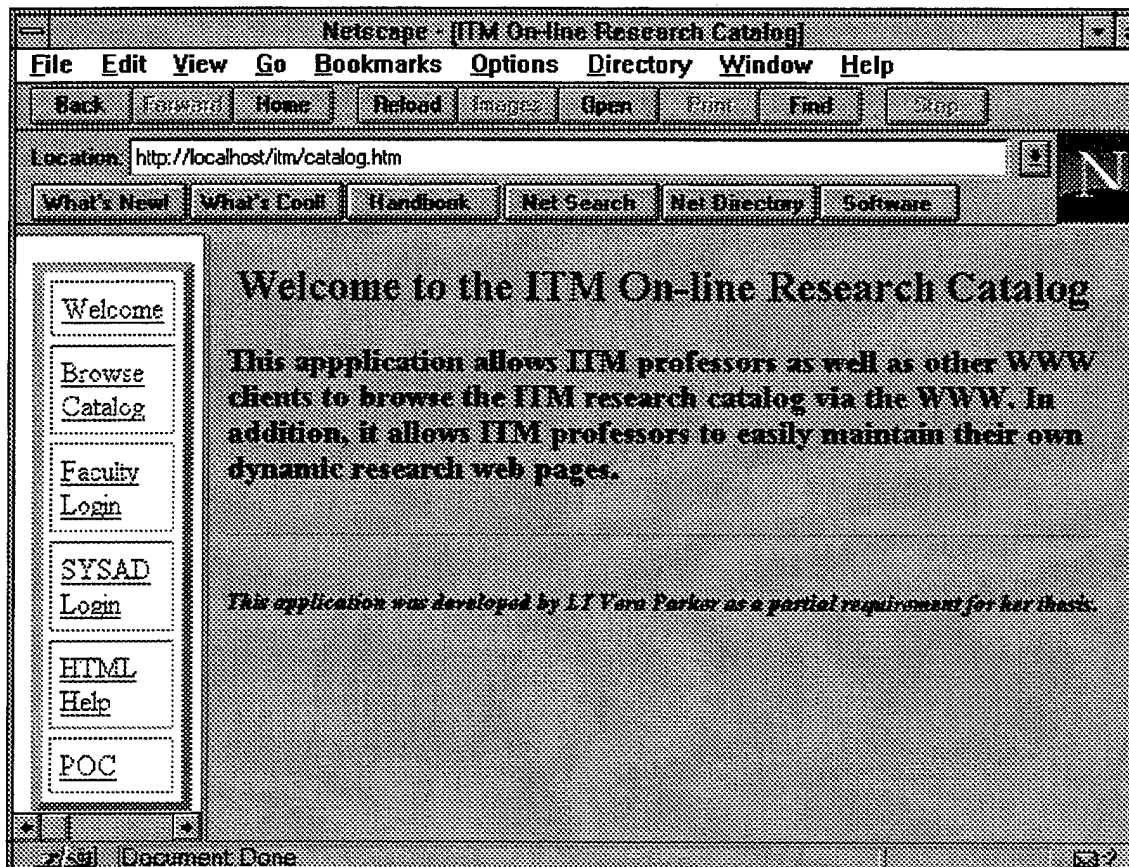

Figure 16. Welcome Menu

A. WWW CLIENTS

The WWW clients can view the contents of the research catalog by selecting the browse catalog option from Figure 16. The Browse Menu, Figure 17, is then displayed to allow the user to select the items he wants to view.

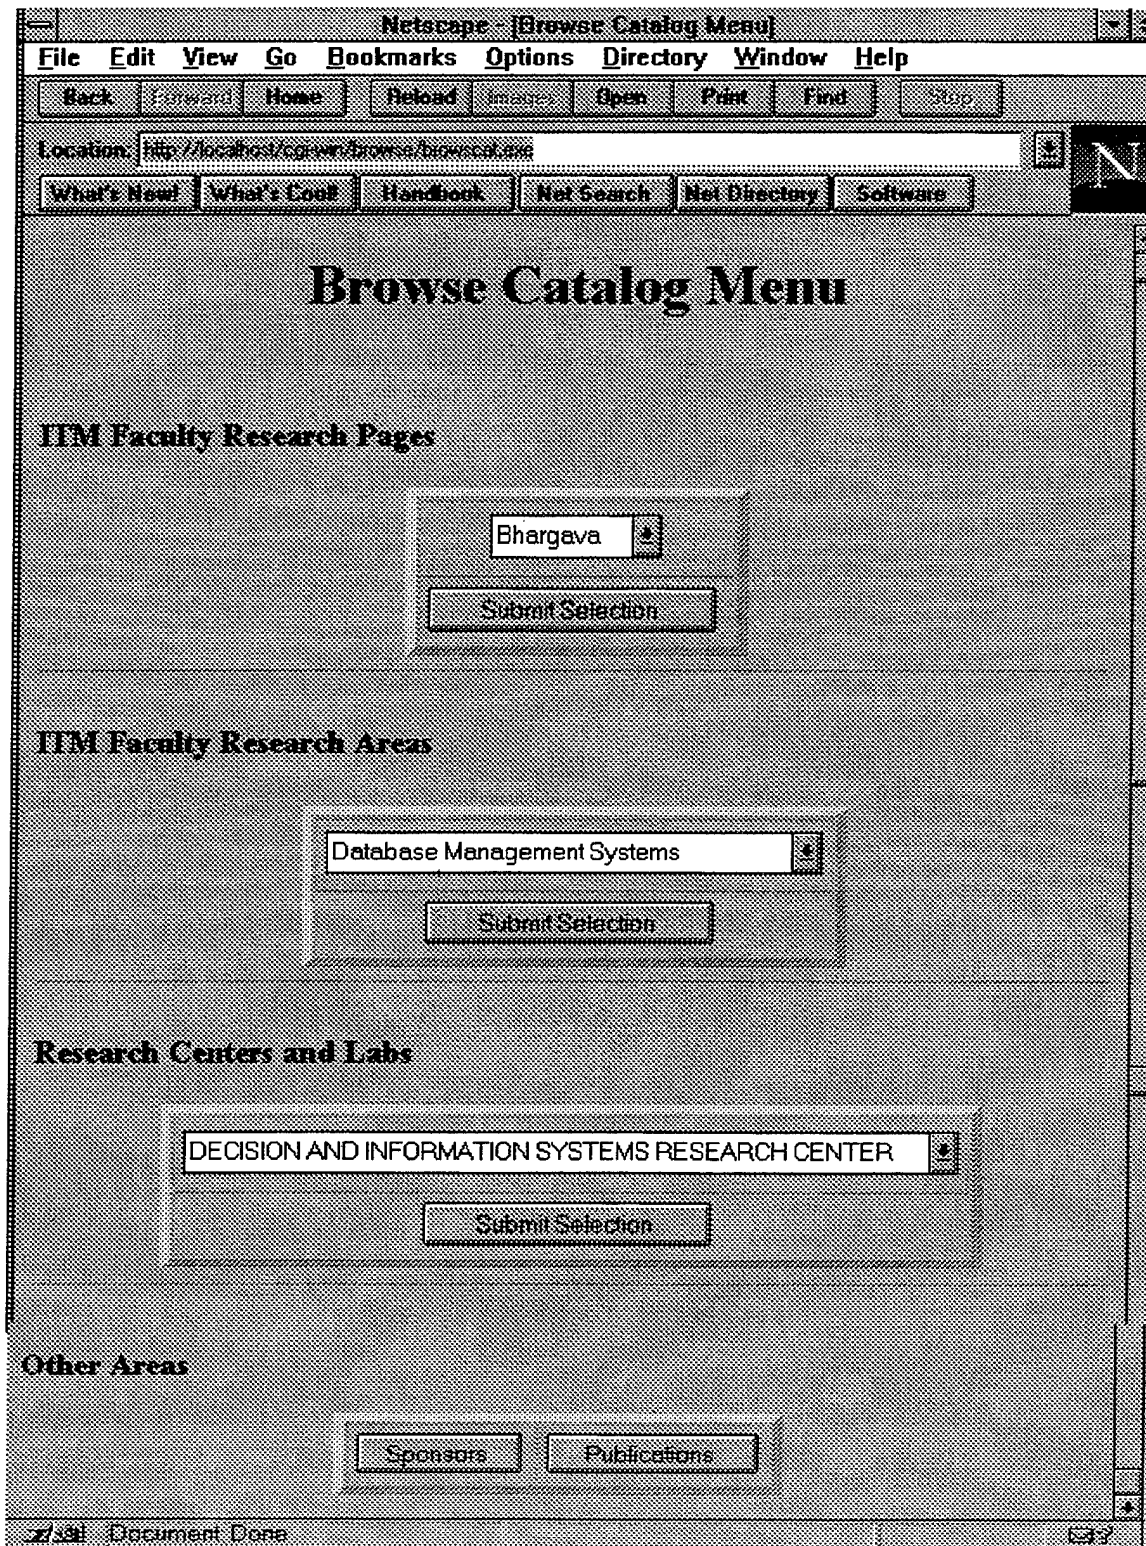

Figure 17. Browse Menu

If a user wants to view a faculty research page, he can select from the drop down list of ITM professors. The drop down list is in alphabetical order by last name.

The display research area option, lets a user view the several broad ITM research areas. If a user selects a research area that has subareas, he is asked to pick a research subarea to view. A research area and research subarea have identical structures, i.e., they both have a brief description and publications associated with them.

The research centers and labs describe current research projects by some of the ITM faculty. A user can view a research center or lab by selecting the browse research centers and labs option.

One of the main objectives of the research catalog is to solicit sponsors for further research. A list of the current research sponsors is viewed by selecting "Sponsors" on the Browse Menu.

The ITM professors have written many publications documenting their research knowledge and findings. They can be viewed by selecting "Publications."

B. ITM FACULTY

A professor can access the catalog to browse its contents or update his research information. If the latter, he has to log into the catalog. Each faculty member is given a faculty code and password that must be entered correctly to access the available selections on the Catalog Menu, Figure 18.

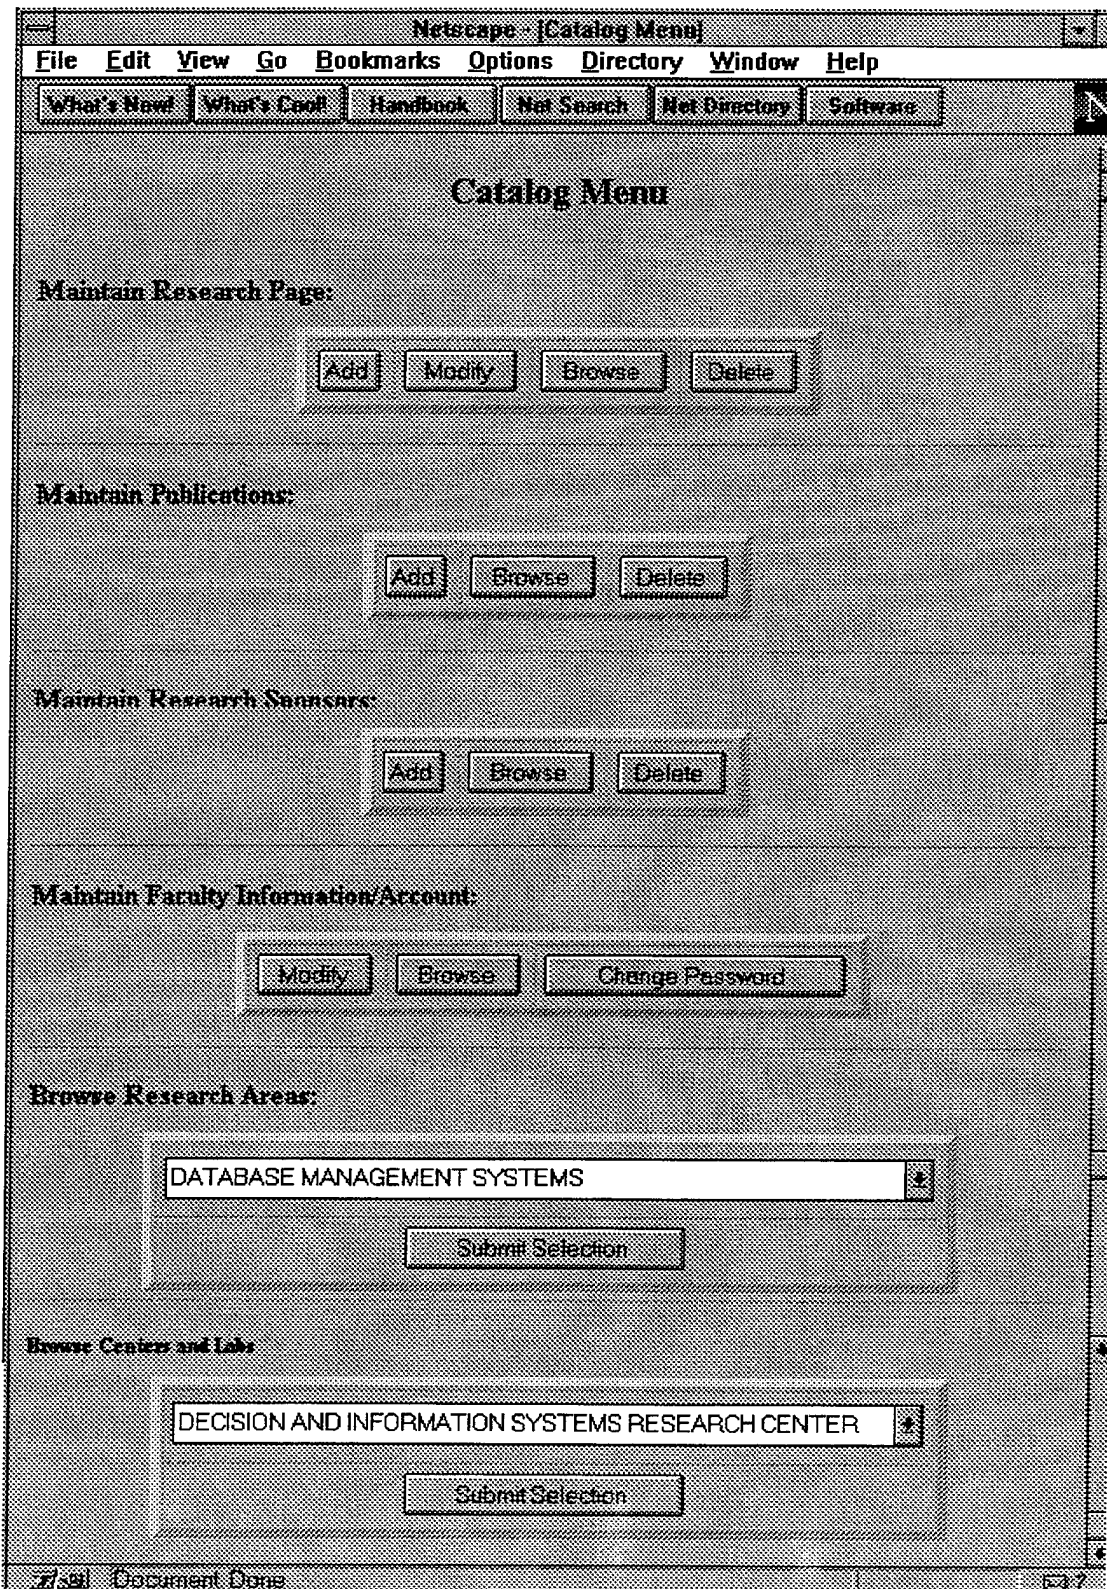

Figure 18. The Catalog Menu

C. SYSTEM ADMINISTRATOR

The system administrator must log into the catalog using his login ID and password to perform any maintenance tasks. Once he is successfully logged in, Figure 19, is displayed for him to choose his selections. The system administrator's "Main Menu" has more options available than the other two menus, because he has the capabilities of those menus as well as additional ones to maintain the catalog's integrity.

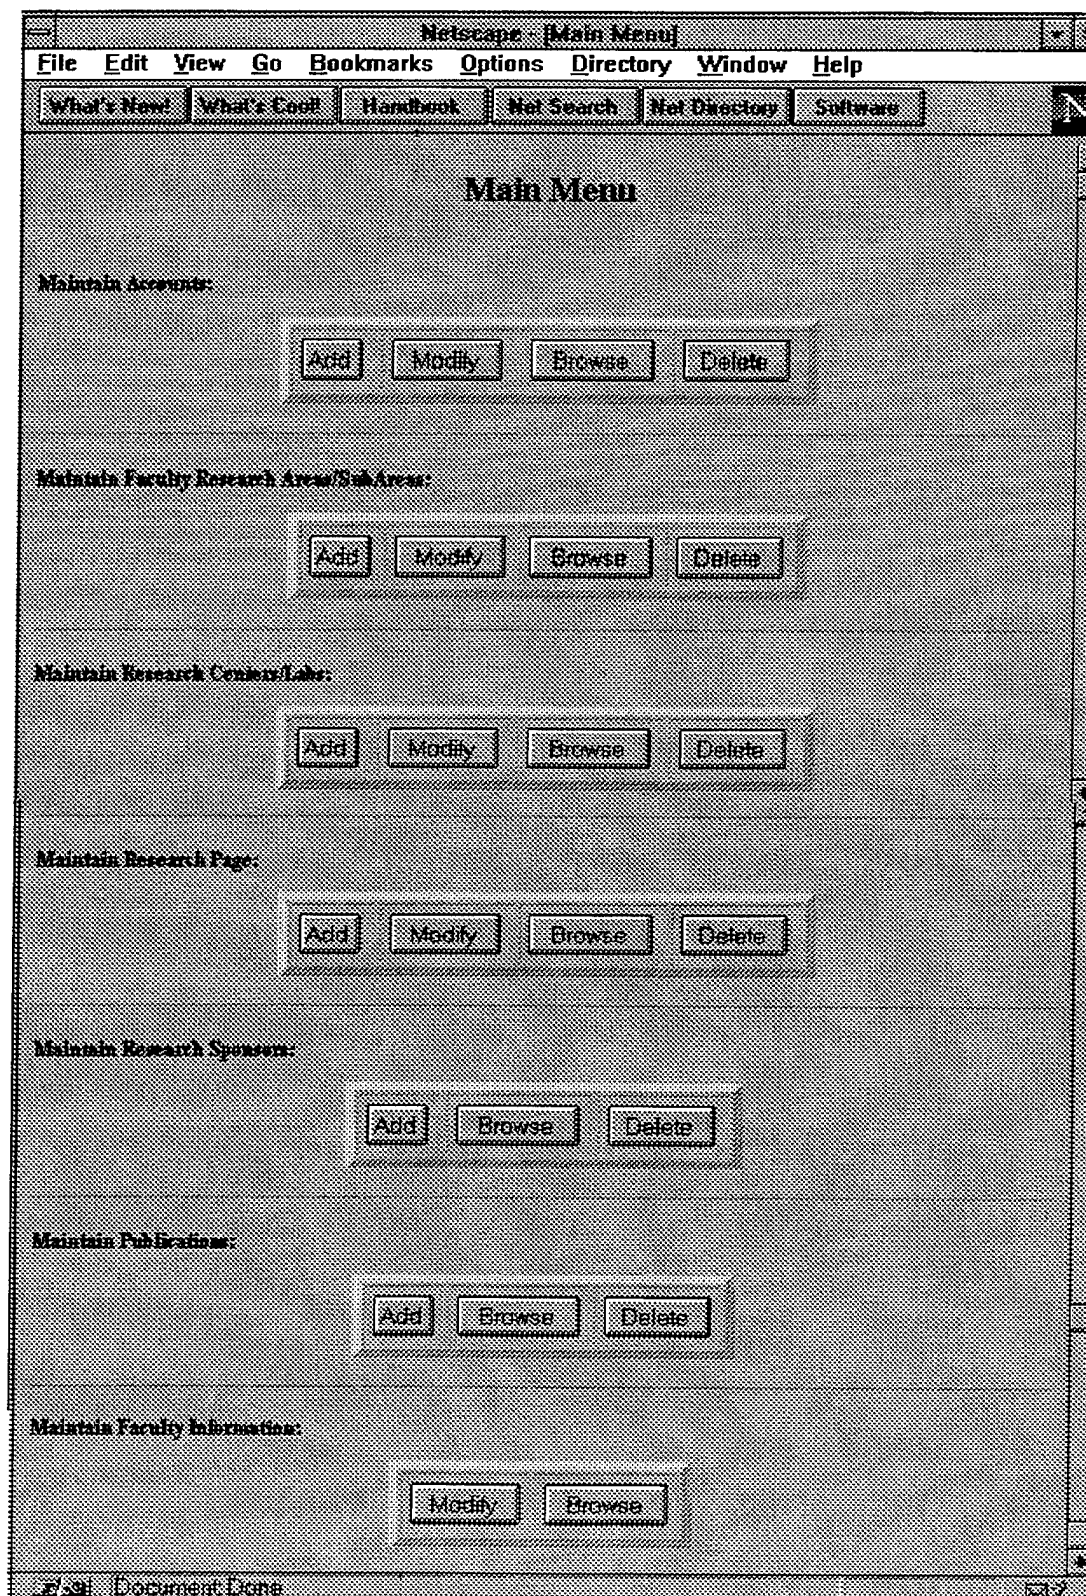

Figure 19. Main Menu

V. CONCLUSIONS AND RECOMMENDATIONS

A. CONCLUSIONS

This thesis is a major improvement to Barbara Franklin's static research catalog web pages. It describes the development and implementation of a relational database approach to easily and quickly maintain the catalog. This seemed to be the most logical solution, since there are relations between the common fields that must be navigable by the system; these relations are most effectively accomplished by relational join operations. By having the application on a WWW server, it makes the research catalog possible to be viewed by potential sponsors, various DOD agencies, and millions of people who have a frames capable browser and access to the WWW. Another important advantage of having the catalog on a server is: (a) it can be maintained by the ITM faculty, and (b) can be done so, regardless of their operating platform. This is due to the TCP/IP protocol that the WWW uses. TCP/IP allows reasonably efficient and error-free transmission between different systems[Ref. 2].

The structured techniques used were critical in the design and implementation of the application. The key to the successful completion of the catalog is the perseverance and over 300 arduous hours the author spent self-learning and programming in Delphi.

The application system developed in this thesis will require the attention of a system administrator to function properly. It is recommended that Christine Smith who currently manages the web pages for the SM Department, be the system administrator for the application. Ideally, access to the catalog should occur via a link from the SM Department's home page. This would provide the best means for the ITM professors and

other WWW clients to use the system. Next, the professors need to be informed about the system and given an account. Once this is done, the professors can use the system at their leisure. The author does not anticipate any need for formal training on how to use the system; the users' interfaces are pretty intuitive. The professors should notify the system administrator if they have any questions, problems, or changes they desire that only the system administrator can perform.

B. RECOMMENDATIONS

Future work is needed to make the on-line research catalog an even better product. The current catalog does not use dynamic SQL statements or has search capabilities. Dynamic SQL statements are statements that are not bound at design-time, but instead are bound when executed by using parameterized SQL statements[Ref. 3]. Parameterized queries give you more flexibility in varying the condition on which you base your SQL statements[Ref. 3]. A search feature would greatly assist users in immediately finding the exact information they want. As the system stands now, a user has to browse through the catalog to ascertain if it contains any information he desires. Also, counters regarding the number of times the catalog pages have been accessed would provide statistical information on the exposure of the research catalog.
